RE: 2023 Annual CCR Fugitive Dust Control Report
Erickson Station

This report serves as the Annual Coal Combustion Residuals Fugitive Dust Control Report prepared in accordance with 40 CFR Part 257.80(c). It outlines measures implemented at the Lansing Board of Water & Light's Erickson Power Station Ash Impoundment System to minimize fugitive dust emissions from coal combustion residuals (CCR). Erickson Power Station is located at 3725 South Canal Road, Lansing, Michigan and was a 165-megawatt coal fired electric generating power plant.

The plant was permanently shut down on November 27, 2022 and ash is no longer being generated. Furthermore, the CCR from the Ash Impoundment System has been removed and the BWL is in the process of seeking clean closure.

Fugitive Dust Control Activities

During 2023, BWL removed visible CCR and liner material plus a one-foot over-excavation below the liner and disposed of the CCR at an offsite landfill. During ash removal activities, ash remained saturated with water with no potential to become fugitive dust.

The surrounding roadways are actively maintained and watered by the BWL as needed and the 15-mph speed limit is observed. Since the Erickson Power Station plant closure, they are rarely traveled (for routine inspections). Access to the site is controlled and public access is restricted.

Citizen Complaints

There were no citizen complaints of CCR fugitive dust at Erickson Station received during this reporting period, January 1, 2023 to December 31, 2023.

Corrective Actions

There were no specific corrective actions taken during this reporting period, January 1, 2023 to December 31, 2023.
