Understanding Steam Service & Basic Charges

Electricity is generated by burning natural gas in a furnace to create heat. In a boiler, the heat converts water into steam, which drives a turbine that drives a generator to make electricity. Cogeneration occurs when a portion of the steam used to generate electricity is extracted from the turbine and distributed to downtown Lansing for sterilizing, laundering, food processing, space and water heating, and other purposes.

Steam rates are made up of a basic service charge, commodity charges, guage size charges (if applicaple) and a minimum charge if the basic service charge does not adequately compensate the BWL for the cost of furnishing service.
